

Yocto at Balena

balena

Building ~70 Unique OS'es for IoT Devices

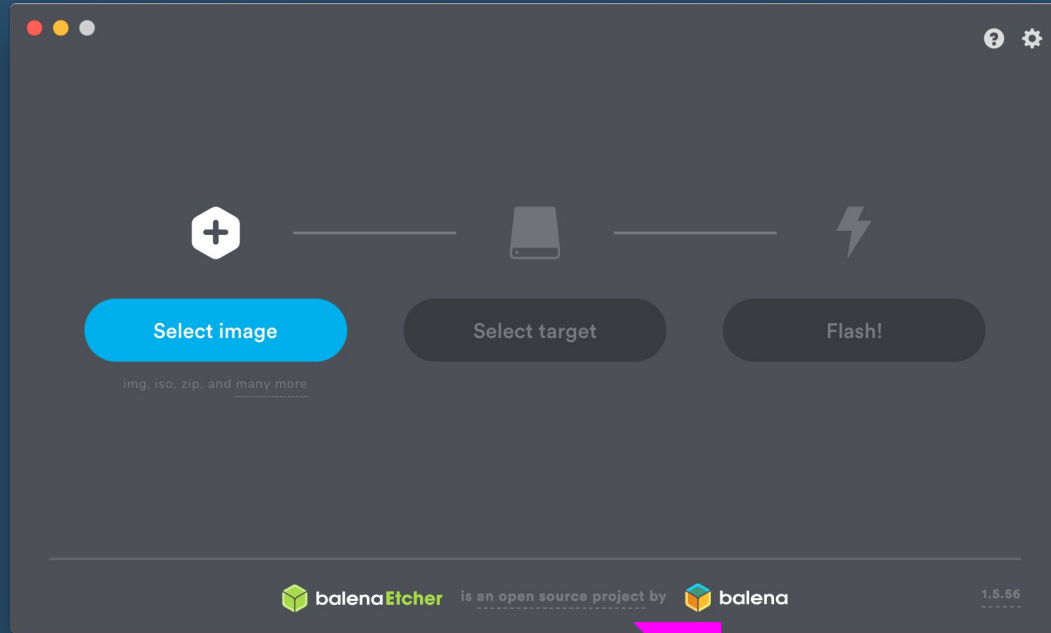

David Tischler
Developer Advocate
t: @balena_io
e: david@balena.io

Who is Balena?

Etcher, anyone?

You could also use ``dd``

balena

“Platform built to develop, deploy, and manage fleets of connected devices at scale.”

- balenaCloud
 - Web-based control of IoT devices, broken down by Applications, Devices, Workloads, and more
 - Terminal access to device, logs, container build info, and more.
- balenaOS
 - Based on Yocto Linux
- balenaEngine
 - Container runtime

balena

What do we mean by IoT
“Fleet Management”?

balenaCloud

?

Architecture

balenaOS

Built on Yocto Linux, Optimized for
Embedded Devices and IoT Usage

- Minimal by design (increased security)
- Less RAM / resource requirements
- Redundant RootFS partitions
- More tolerant of power loss
- Minimized SD Card writes

balenaOS

balenaEngine

Container engine built for Embedded and IoT use-cases, based on the Moby Project from Docker

- Minimal by design
- Less RAM / resource requirements
- Delta pulls to save bandwidth
- Fault tolerance on container pulls

balenaEngine

```
Ubuntu1804-1 [Running]
Thu 16:32
david@david-VirtualBox: ~
File Edit View Search Terminal Help
david@david-VirtualBox:~$ balena help
Usage: balena [COMMAND] [OPTIONS]

If you need help, or just want to say hi, don't hesitate in reaching out
through our discussion and support forums at https://forums.balena.io

For bug reports or feature requests, have a look at the GitHub issues or
create a new one at: https://github.com/balena-io/balena-cli/issues/

Primary commands:

help [command...]      show help
login                  login to balena
push <applicationOrDevice> Start a remote build on the balena cloud build servers or a local mode device
logs <uuidOrDevice>      show device logs
ssh <applicationOrDevice> [serviceName] SSH into the host or application container of a device
apps                   list all applications
app <name>              list a single application
devices                list all devices
device <uuid>           list a single device
tunnel <deviceOrApplication> Tunnel local ports to your balenaOS device
preload <image>          preload an app on a disk image (or Edison zip archive)
build [source]          Build a single image or a multicontainer project locally
deploy <appName> [image] Deploy a single image or a multicontainer project to a balena application
join [deviceIp]         Promote a local device running balenaOS to join an application on a balena server
leave [deviceIp]        Detach a local device from its balena application
scan                   Scan for balenaOS devices in your local network

Run 'balena help --verbose' to list additional commands

Global Options:

--help, -h
--version, -v
david@david-VirtualBox:~$
```

Adding a new board

<https://github.com/balena-os>

- Does your board have a Yocto build already?
- Check for existing “similar” boards
 - SoC Manufacturer
 - Product Line
- If so, clone the appropriate repo and begin porting in your board
- If not, then you will need to go the longer way (but not terrible), which is starting from scratch as documented here:
 - <https://www.balena.io/os/docs/custom-build/>

Building your Own

Bake your own Image

In order to build your very own version of balenaOS for one of our supported boards, you will first need to make sure you have a working [Yocto environment setup](#). Then pick the device type you want to build, in this example we will use the Raspberry Pi 3. So first we need to grab the `balena-raspberrypi` and initialise all its submodules.

```
git clone https://github.com/balena-os/balena-raspberrypi
cd balena-raspberrypi
git submodule update --init --recursive
```

We can then use the helpful `BARYS` tool to setup up and start our build. To see all the functionality `BARYS` provides run `./balena-yocto-scripts/build/barys -h` from within in the repo.

Now to actually build a development version of balenaOS for the Raspberry Pi 3, we can run the following:

```
./balena-yocto-scripts/build/barys -m raspberrypi3
```

Now sit tight and maybe go and make several cups of tea, this is going to take a little while.

Supporting your Own Board

Pre-requisites: a [Yocto Board Support Package \(BSP\)](#) layer for your particular board. It should be compatible to the Yocto releases balenaOS supports.

Repositories used to build balenaOS host Operating System (OS) are typically named `balena-<board-family>`. For example, consider `balena-raspberrypi` which is used for building the OS for [Raspberrypi Pi](#), or `balena-intel` repository which can be used to build a balena image for the Intel NUC boards.

Yocto Project Call-to-Action

- https://lists.yoctoproject.org/g/yocto/topic/open_source_maintainers_an/82722441
 - There are a few things companies can do to help:
 - a) Publicly acknowledge you use the project.
 - b) Embrace employee's Open Source contributions, code and otherwise
 - c) Consider Yocto Project membership
 - d) Support employees in spending some time on open source projects
 - e) Transition roles
- <https://www.yoctoproject.org/join/>
